Sonoran Tiger Salamander
(Ambystoma tigrinum stebbinsi)

U.S. Fish and Wildlife Service

Protected at Fort Huachuca (Arizona)

Habitat: Grasslands in southern Arizona and possibly northern Sonora, Mexico. Adult salamanders live in burrows in nearby grassy areas or oak woodlands when not in ponds.

Begin their life as jelly-coated eggs laid in water; larvae hatch in the spring and live in water; they have plume-like gills and well-developed tail fins.

A large salamander that grows 2.5 to 5 inches long.

One of three subspecies of tiger salamanders native to Arizona.

Listed as endangered on January 6, 1997.

Front

Design provided by U.S. Army Environmental Command

For more information: USAEC Public Affairs Office (410) 436-2556

The U.S. Army is the steward of more than 15 million acres of land across many diverse ecosystems. Because of the way the Army trains on and manages this land, these natural environments have become havens of plant and animal biodiversity.

Of the approximately 1,300 plants and animals federally listed as threatened or endangered, more than 170 are found on Army lands in the United States.
